

It's your body.

Now you can decide how you can be treated.

This is a campaign, for women, about women, and about their bodies. It's about giving you the vote on the development of a new treatment for breast cancer. Maybe for other women's cancers, too. And it's giving you the chance to get involved. "I did it. I made a difference. Because of me ... and people like me. Because I care. Because WE care."

It's about you playing your part, building a network of women around the world who are going to 'do it for themselves'.

The therapy we are funding will treat breast cancer without the need for destructive, emotionally damaging surgery. And one treatment should kill the cancer. It's called PDT - Photodynamic Therapy. It's used now for skin cancer, mouth and early lung cancer, prostate and even vulval and penile cancer. I bet you never knew that PDT existed. But you do now. You can make more vital life decisions now for you and those you care about.

The team behind delivering PDT for breast cancer is led by one of the world's most influential breast cancer specialists. Dr Mohammed Keshtgar has played a vital part in developing Intra-Operative Radiotherapy and most recently his new micro surgery techniques.

But we still need PDT. It completes our list of treatment options as an alternative to surgery, radiotherapy and chemotherapy. We will be funding this work in London at the Royal Free Hospital (part of UCL) and in Boston, Massachusetts, USA, and delivering this new, fully approved treatment, to the world.

It's your choice.

Do you want a better way to treat breast cancer?

If you do, the way forward is easy. Just email this file to all your friends around the world. Within weeks, millions of women will be part of this life-changing campaign. For you. For me. For our children.

Add your own personal story about breast cancer in the covering email, if you like, and ask your friends to do the same. Spread the word. We can do it. Donate as little or as much as you like. Just £10 or \$20 from half a million women will see us reach our target.

And if we raise more, then we'll find the medical teams to research and deliver other new PDT solutions for women's cancers and medical conditions that also avoids surgery, radiotherapy and chemotherapy.

PDT is a one-off treatment that uses a light-sensitive drug that, when activated in the cancer with light, kills tumours quickly by stopping the oxygen supply to the cancer. And there are none of the dreadful side effects such as prolonged nausea, white blood cell damage and hair loss. It's a gentle way to kill cancer. And we deserve it. Click on the KILLING Cancer logo to go to the website where you can donate quickly and easily. Together, we WILL make the difference. We already are.
